

Useful Troubleshooting Tips

Common App Connector Issues

Issue	Troubleshooting steps
App Connector Upgrade Failure	• Collect the outputs for the following: sudo cat /opt/zscaler/var/version sudo ls -lrta /opt/zscaler/var/version sudo cat /opt/zscaler/var/updater.version sudo /opt/zscaler/var/image.bin -version sudo ls -lrta /opt/zscaler/var/image • Image can not download since there is no disk space left. Check the disk space for the following directories: sudo df -h / sudo du -h / sudo du -a/ -n -r head -n • Delete any extra directories, except/pt/zscaler, to free up space. Once disk space is available, the image downloads to opt/zscaler/var/image.bin.
App Connector Status “Disconnected”	• Test connectivity to the upstream ZPA Public Service Edge by querying the DNS address co2br.prod.zpath.net from the server that is running the App Connector software. • Make sure all the IP ranges allowed by the firewall match those in the ZPA firewall policies: config.zscaler.com/private.zscaler.com/zpa.

Performance Issue

Here is a list of questions that you may ask while troubleshooting an issue:

- Is this a new issue or an existing one?
- Are other users affected?
- What's the common pattern among them?
- What kind of internet link is the user connected to? For example: Is it an ethernet link or Wi-Fi?
- Is the user accessing from a single location, or is he moving between different locations such as home/office/hotel?
- Is the problem present regardless of the location where the user connects from or is it specific to a single location?
- Is the problem specific to a single application, a single connector group, or is it present everywhere over ZPA?
- Is the problem present when ZPA is not connected (when accessing internet resources in general)?
- Is there a different method of accessing the same application and does it show similar symptoms?
- Is there more than one internet link present on the site?
- Is the problem present if the user is connecting over an alternate internet link?

Performance Issue (contd.)

Performance issues could potentially reside on one of these paths and the corresponding troubleshooting tips help to isolate where the issue might be originating from:

1. Client to ZPA Service Edge.
 - a. Run a ping test
 - b. Run an ICMP MTR
 - c. Test internet throughput by running a speed test from a server in the vicinity of the Service Edge's geographic location
 - d. Collect Packet capture from the ZCC while accessing the application
2. App Connector to ZPA Service Edge.
 - a. Run a ping test
 - b. Run an ICMP MTR
3. App Connector to Server delivering the application.
 - a. Run a ping test
 - b. Run an ICMP MTR
 - c. Collect Packet capture from the AppConnector while accessing the application

Zscaler Client Connector Log

- Collect Zscaler Client Connector log by first clearing the logs, start the packet capture (important) and let the problem reproduce again and then export the logs to be shared with support.
- App Connector Logs [the packet capture on the Zscaler client connector and app connector should be done simultaneously]
 - SSH/Access the app connector as admin and initiate packet capture `""tcpdump -sO -i any -nn -w /var/tmp/<relavent_file_name>.pcap""` [Note – please replace <relavent_file_name> with actual file name]
 - Press Ctrl+C on the app connector to stop the packet capture once issue has been reproduced(Important)
 - Enter this command `cd /var/tmp` and then run this `""sudo /var/log/messages > journal_logs.txt""` [Note – you can name journal_logs.txt as any relevant name]
 - Run this command – `""cat /var/log/messages""` and copy the messages for the +-2 minutes of the duration when the test was made and paste it on your local machine to be shared with support later
- Upload ZCC exported logs, connector logs [pcap,journal logs & /var/log/messages] to this location – <https://tools.zscaler.com/upload/> [Password: Z9VEp5NCVxpLdFU] and once done, share the direct download link that is generated after the upload is completed.
- Go to ZPA portal -> Analytics -> Diagnostics -> and filter for the affected username and domain. Expand the logs for the attempt from which the above logs are captured and click on copy icon under `""connection status log""`
